value 6 operates in the compression phase only

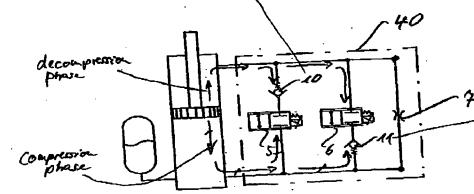

Values 5 and 6 provide the damping forces in the compression (value 6) and decompression phase (value 5). Thus, values 5 and 6 are shock absorption components.

Fig. 1

~8-

Check valor 10 is closed in that's why only value 6 sperates the decompression phase, that's why only value 6 sperates in the decompression phase

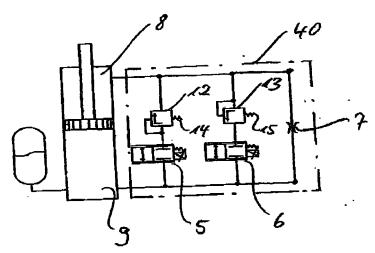

Chrck-valve 11
is closed in the
Compression
phase, that's
why only valve 5
operates in the
Occomposition phase

Values 5 and 6 both operate in the compression and in the decompression phase (see double-arrow in element 5 and 6). decompression phase (see double-arrow in element 5 and 6). Check-values 10 and 11 defermine which one of the values that is in operation.

Like in Fig. 1, only the valoes 5 and 6 provide the damping forces and thus operate as shock absorption components.

Fig. 2

Same concept as Fig. 2, basically.

The only differece: Values 12, 13 are spring-loaded by

Spring 14, 15. Thus, value 12 contributes

to the damping effect in the due compression phase

and value 13 contributes to the damping

effect in the decompression phase.
